Understanding Two-Dimensional Figures

Two-dimensional figures, or 2D shapes, are flat shapes that have only two dimensions: length and width. Unlike three-dimensional shapes, they do not have depth. The study of these figures includes various aspects such as classification, area, perimeter, and properties.

Common Two-Dimensional Figures

1. Triangles
 - Types: Isosceles, Equilateral, Scalene
 - Properties: Three sides and three angles.
2. Quadrilaterals
 - Types: Squares, Rectangles, Rhombuses, Trapezoids, Parallelograms
 - Properties: Four sides and angles that sum up to 360 degrees.
3. Circles
 - Properties: Defined by a center point and a radius; all points on the circle are equidistant from the center.
4. Polygons
 - Definition: A closed figure with three or more straight sides.
 - Properties: Regular (all sides and angles are equal) or irregular.

Answer Key

1. Identify the Figure
- a. Square
- b. Triangle
2. Calculate the Area
- a. $\text{Area} = \text{Length} \times \text{Width} = 5 \times 3 = 15$ square units
- b. $\text{Area} = \frac{1}{2} \times \text{Base} \times \text{Height} = \frac{1}{2} \times 4 \times 3 = 6$ square units
3. Perimeter Calculation
- a. $\text{Perimeter} = 4 \times \text{Side} = 4 \times 6 = 24$ units
- b. $\text{Perimeter} = 2 \times (\text{Length} + \text{Width}) = 2 \times (8 + 2) = 20$ units
4. Symmetry Identification
- a. A regular hexagon has 6 lines of symmetry.
- b. Yes, a rectangle has rotational symmetry of order 2 (it looks the same after a 180-degree rotation).
5. Transformations
- a. The triangle will mirror itself across the y-axis, reversing its orientation.
- b. The rectangle will remain the same shape but will occupy a different position in the coordinate plane.
