Detailed Answers to Key 12 1 Review Questions

Providing detailed answers to key questions from the 12 1 review and reinforcement section reinforces understanding and clarifies common areas of difficulty. The following explanations illustrate typical solutions and reasoning processes.

Example Question 1: Concept Explanation

Question: Define the primary function of the cardiovascular system as discussed in section 12 1.

Answer: The cardiovascular system's primary function is to transport blood, nutrients, oxygen, and waste products throughout the body. It maintains homeostasis by delivering oxygen and essential substances to tissues and removing carbon dioxide and metabolic wastes.

Example Question 2: Diagram Labeling

Question: Identify and label the main components of the heart shown in the diagram.

Answer: The main components include the atria (left and right), ventricles (left and right), valves (tricuspid, pulmonary, mitral, aortic), and major blood vessels (aorta, pulmonary arteries, pulmonary veins, vena cava). Each part plays a specific role in directing blood flow through the heart and to the lungs and body.

Example Question 3: Calculations Involving Heart Rate

Question: Calculate the cardiac output given a heart rate of 70 beats per minute and stroke volume of 70 mL.

Answer: Cardiac output (CO) is calculated by multiplying heart rate (HR) by stroke volume (SV). $CO = HR \times SV = 70 \text{ beats/min} \times 70 \text{ mL/beat} = 4900 \text{ mL/min}$ or 4.9 L/min.
