Frequently Asked Questions

What is the purpose of the SELECT statement in SQL Server 2012?

The SELECT statement is used to query and retrieve data from one or more tables in SQL Server. It allows users to specify which columns to return and to filter, sort, and group the results.

How can you implement filtering in your SQL queries when using SQL Server 2012?

You can implement filtering in SQL queries by using the WHERE clause to specify conditions that the data must meet to be included in the result set. For example, 'SELECT FROM Employees WHERE Department = 'Sales'.

What are the differences between INNER JOIN and LEFT JOIN in SQL Server 2012?

INNER JOIN returns only the rows that have matching values in both tables involved in the join, while LEFT JOIN returns all rows from the left table and the matched rows from the right table; if there is no match, NULL values are returned for columns from the right table.

What functions can you use in SQL Server 2012 to aggregate data?

In SQL Server 2012, you can use aggregate functions such as COUNT(), SUM(), AVG(), MIN(), and MAX() to perform calculations on a set of values and return a single value, often used in conjunction with the GROUP BY clause.

How can you optimize query performance in SQL Server 2012?

You can optimize query performance by using indexing, avoiding SELECT *, using appropriate joins, analyzing and updating statistics, and leveraging execution plans to identify and rectify performance
