- 2010s: Breakthroughs in deep learning drive advancements in image recognition, speech recognition, and NLP.

Core Concepts in AI 102

AI 102 builds on basic AI principles to explore more complex ideas and technologies. This section outlines the core concepts that students should focus on.

1. Types of AI

AI can generally be classified into three categories:

- Narrow AI: AI systems designed to perform a narrow task (e.g., voice assistants).
- General AI: A theoretical form of AI where a system possesses the ability to perform any intellectual task that a human can do.
- Superintelligent AI: An advanced form of AI that surpasses human intelligence across virtually all areas.

2. Machine Learning Algorithms

A significant part of AI 102 involves understanding various machine learning algorithms, including:

- Supervised Learning: The model is trained on labeled data. Examples include regression and classification tasks.
- Unsupervised Learning: The model finds hidden patterns or intrinsic structures in the input data. Examples include clustering and association.
- Reinforcement Learning: An agent learns to make decisions by receiving rewards or penalties for actions taken within an environment.

3. Neural Networks

Neural networks are pivotal to deep learning and AI. Students should understand:

- Architecture: The structure of neural networks, including input layers, hidden layers, and output layers.
- Activation Functions: Functions that determine whether a neuron should be activated, such as sigmoid, ReLU, and softmax.
- Training Processes: Techniques like backpropagation and optimizers (e.g., Adam, SGD) to adjust weights and minimize loss.
