Overview of AISC and the ASD Method

The American Institute of Steel Construction (AISC) is an authoritative organization that focuses on advancing the steel construction industry. The AISC code sets the standard for the design, fabrication, and erection of steel structures. The Allowable Strength Design (ASD) method is one of the primary design approaches promoted by AISC, focusing on establishing design criteria based on allowable stresses rather than ultimate strengths.

What is the ASD Method?

The ASD method emphasizes the use of allowable stress levels, derived from the material properties and safety factors, to ensure that structures can safely support anticipated loads. Key features include:

1. **Load Combinations:** ASD incorporates various load combinations, which account for different loading scenarios that a structure may encounter.
2. **Safety Factors:** Safety factors are applied to account for uncertainties in material properties and load estimations.
3. **Serviceability:** The method also considers serviceability limits, such as deflection and vibration, ensuring that structures perform adequately under normal use.
