Solving Linear Equations

Solving linear equations is a fundamental skill in algebra 1. These equations typically involve variables with an exponent of one and can be solved using various methods such as addition, subtraction, multiplication, division, and the distributive property. Practice problems in this area reinforce understanding of balancing equations and isolating variables.

One-Step Equations

One-step equations require only a single operation to solve for the variable. These problems help build confidence in basic algebraic manipulation.

1. Solve for x : $x + 7 = 12$
2. Solve for y : $5y = 25$
3. Solve for z : $z / 4 = 3$

Answers:

1. $x = 5$
2. $y = 5$
3. $z = 12$

Two-Step Equations

Two-step equations involve two operations and require sequential steps to isolate the variable. Understanding the order of operations and inverse operations is key.

1. $3x + 4 = 19$
2. $2y - 5 = 9$
3. $(1/2)z + 6 = 10$

Answers:

1. $x = 5$
2. $y = 7$
3. $z = 8$

Simplifying Algebraic Expressions

Simplifying expressions involves combining like terms and applying the distributive property to rewrite expressions in their simplest form. This skill is critical for solving equations and understanding algebraic relationships.

Combining Like Terms

Like terms share the same variable raised to the same power. Combining them reduces the complexity of expressions.

1. Simplify: $3x + 5x - 2$
2. Simplify: $7y - 3 + 2y + 8$
3. Simplify: $4a + 3b - 2a + 5b$

Answers:

1. $8x - 2$
2. $9y + 5$
3. $2a + 8b$

Using the Distributive Property

The distributive property allows multiplication over addition or subtraction inside parentheses, which is essential for simplifying and solving equations.

1. Simplify: $5(x + 3)$
2. Simplify: $2(3y - 4)$
3. Simplify: $-3(2a + 5)$

Answers:

1. $5x + 15$
2. $6y - 8$
3. $-6a - 15$

Working with Inequalities

Inequalities express relationships where values are not equal but rather greater than, less than, or equal to certain bounds. Solving and graphing inequalities is a crucial part of algebra 1 curriculum.

Solving Linear Inequalities

Solving inequalities involves similar steps to equations but requires special attention to the direction of the inequality when multiplying or dividing by negative numbers.

1. Solve: $x + 5 > 12$
2. Solve: $4y - 3 \leq 13$
3. Solve: $-2z > 6$

Answers:

1. $x > 7$
2. $y \leq 4$
3. $z < -3$

Graphing Inequalities on a Number Line

Graphing inequalities visually represents the solution set, making it easier to understand the range of possible values for the variable.

- Open circle for *greater than* or *less than* (no equality)
- Closed circle for *greater than or equal to* or *less than or equal to*
- Shade the number line to indicate all possible solutions

Understanding Functions and Graphs

Functions are relationships between inputs and outputs where each input corresponds to exactly one output. Recognizing functions and interpreting their graphs is a vital skill in algebra 1.

Identifying Functions

A function can be identified by ensuring each input has only one output. This concept is often tested using ordered pairs, tables, or mapping diagrams.

1. Determine if the set $\{(1, 2), (2, 3), (3, 4)\}$ is a function.
2. Determine if the set $\{(1, 2), (1, 3), (2, 4)\}$ is a function.

Answers:

1. Yes, each input has one output.
2. No, input 1 has two different outputs.

Graphing Linear Functions

Graphing linear functions involves plotting points and drawing a straight line that represents the equation. Understanding slope and intercepts is key to accurate graphing.

1. Graph $y = 2x + 1$
2. Graph $y = -x + 4$

Answers:

For $y = 2x + 1$, plot points such as (0,1), (1,3), and (2,5) and draw a line through them. For $y = -x + 4$, plot points (0,4), (1,3), and (2,2) and connect with a straight line.

Word Problems and Applications

Word problems apply algebraic concepts to real-world situations. Practicing these problems develops the ability to translate verbal information into algebraic expressions and equations.

Translating Word Problems into Equations

Understanding key phrases and operations in word problems is essential for setting up correct equations.

- "Sum of" translates to addition
- "Difference between" translates to subtraction
- "Product of" translates to multiplication
- "Quotient of" translates to division

1. The sum of a number and 7 is 15. Find the number.
2. Three times a number decreased by 4 equals 11. Find the number.

Answers:

1. $x + 7 = 15 \rightarrow x = 8$
2. $3x - 4 = 11 \rightarrow x = 5$

Solving Rate and Distance Problems

Rate and distance problems often involve the formula $\text{distance} = \text{rate} \times \text{time}$ and require setting up equations based on given information.

1. A car travels at 60 miles per hour for 3 hours. What is the distance traveled?
2. A cyclist travels 24 miles in 2 hours. What is the cyclist's speed?

Answers:

1. Distance = $60 \times 3 = 180$ miles
2. Speed = $24 \div 2 = 12$ miles per hour
