Linear Equations and Inequalities

Understanding linear equations and inequalities is foundational for the Algebra 1 Regents exam. This section focuses on forming, solving, and graphing these expressions, which frequently appear on the test.

Solving Linear Equations

Linear equations are algebraic expressions of the first degree, typically in the form $ax + b = c$. To solve such equations, isolate the variable on one side by performing inverse operations. Key steps include:

- Adding or subtracting terms on both sides.
- Dividing or multiplying both sides by a nonzero coefficient.
- Checking the solution by substituting back into the original equation.

Example: Solve $3x + 5 = 14$.

Subtract 5 from both sides: $3x = 9$. Divide both sides by 3: $x = 3$.

Graphing Linear Equations

Graphing involves plotting points that satisfy the equation on the coordinate plane. The slope-intercept form, $y = mx + b$, is useful, where m is the slope and b is the y-intercept.

- Slope (m): Rate of change or steepness of the line.
- Y-intercept (b): The point where the line crosses the y-axis.

To graph, start at the y-intercept and use the slope to find additional points.

Solving and Graphing Inequalities

Inequalities resemble equations but use inequality symbols such as $<$, $>$, $\leq$, or $\geq$. Solving them follows similar steps to equations, but the inequality direction reverses when multiplying or dividing by a negative number.

Graphs of inequalities show solution regions using shading, with a solid or dashed boundary line depending on whether the inequality includes equality.

Functions and Graphing

Functions are fundamental concepts tested on the Algebra 1 Regents exam. This section covers definition, evaluation, and graphing of functions.

Definition of a Function

A function assigns exactly one output value for each input value. It is often written as $f(x)$, representing the output when x is the input.

Key properties include domain (possible input values) and range (possible output values).

Evaluating Functions

To evaluate a function, substitute the input value into the function expression and calculate the result. For example, if $f(x) = 2x + 3$, then $f(4) = 2(4) + 3 = 11$.

Graphing Functions

Graphing a function involves plotting ordered pairs $(x, f(x))$ on the coordinate plane. Linear functions

produce straight lines, while nonlinear functions may produce curves.

- Identify key points by evaluating the function at specific x-values.
- Plot points and connect them smoothly.
- Note intercepts and behavior as x increases or decreases.

Polynomials and Factoring

Polynomials are algebraic expressions consisting of variables and coefficients combined using addition, subtraction, and multiplication. Mastery of polynomial operations and factoring techniques is critical for the exam.

Polynomial Operations

Operations include addition, subtraction, multiplication, and division of polynomials. Remember to combine like terms carefully and apply the distributive property when multiplying.

Factoring Techniques

Factoring simplifies polynomials into products of simpler expressions. Common methods include:

- Factoring out the greatest common factor (GCF).
- Factoring trinomials of the form $ax^2 + bx + c$.
- Difference of squares: $a^2 - b^2 = (a - b)(a + b)$.
- Factoring by grouping.

Example: Factor $x^2 + 5x + 6$.

Look for two numbers that multiply to 6 and add to 5: 2 and 3.

Factored form: $(x + 2)(x + 3)$.

Quadratic Equations

Quadratic equations are second-degree polynomials that appear frequently on the Algebra 1 Regents exam. Understanding their forms and solving methods is crucial.

Forms of Quadratic Equations

Quadratics can be expressed as:

- Standard form: $ax^2 + bx + c = 0$.
- Vertex form: $y = a(x - h)^2 + k$, where (h, k) is the vertex.
- Factored form: $y = a(x - r_1)(x - r_2)$, where r_1 and r_2 are roots.

Solving Quadratic Equations

There are several methods to solve quadratic equations:

1. Factoring: Express the quadratic as a product of binomials and set each factor to zero.
2. Quadratic formula: $x = (-b \pm \sqrt{b^2 - 4ac}) / 2a$, applicable to all quadratics.
3. Completing the square: Rewriting the quadratic to isolate a perfect square trinomial.

Graphing Quadratic Functions

The graph of a quadratic function is a parabola. Important features include:

- Vertex: The highest or lowest point, depending on the parabola's direction.
- Axis of symmetry: A vertical line through the vertex, $x = h$.
- Direction: Upward if $a > 0$, downward if $a < 0$.

Exponents and Radicals

Exponents and radicals are integral to Algebra 1 topics and the Regents exam. This section outlines the laws of exponents and introduces radical expressions.

Laws of Exponents

Key exponent rules include:

- **Product rule:** $a^m \cdot a^n = a^{m+n}$

- **Quotient rule:** $a^m / a^n = a^{\{m-n\}}$ (for $a \neq 0$)
- **Power rule:** $(a^m)^n = a^{\{mn\}}$
- **Zero exponent:** $a^0 = 1$ (for $a \neq 0$)
- **Negative exponent:** $a^{-n} = 1 / a^n$ (for $a \neq 0$)

Radicals and Simplifying

Radicals represent roots, primarily square roots in Algebra 1. Understanding how to simplify radical expressions and convert between exponential and radical forms is necessary.

- $\sqrt{a} = a^{\{1/2\}}$
- To simplify, factor the radicand into perfect squares.
- Rationalize the denominator by eliminating radicals from the denominator.

Additional Algebraic Concepts

This section provides an overview of supplementary topics frequently encountered on the Algebra 1 Regents exam, rounding out the cheat sheet.

Systems of Equations

Systems of linear equations involve finding solutions that satisfy multiple equations simultaneously. Methods include substitution, elimination, and graphing.

Inequalities in Two Variables

Graphing linear inequalities in two variables requires shading the solution region on the coordinate plane. The boundary line may be solid or dashed based on the inequality type.

Absolute Value Equations and Inequalities

Absolute value represents the distance from zero and is always nonnegative. Equations and inequalities involving absolute value require considering two cases.

Example: Solve $|x - 3| = 5$.

Cases:

- $x - 3 = 5 \rightarrow x = 8$
- $x - 3 = -5 \rightarrow x = -2$
