- Screwdriver (Phillips and flathead)
- Wrench set
- Level
- Measuring tape
- Drill and drill bits
- Refrigerant lines (if not included)
- Electrical wiring (as specified in the manual)
- Condensate drain line
- Insulation for refrigerant lines
- Mounting brackets (if applicable)
- Safety gear (gloves, goggles)
- Vacuum pump
- Manifold gauge set

### 2. Review Local Codes and Regulations

Before starting the installation, check local building codes and regulations to ensure compliance. Some areas may have specific requirements regarding air conditioning installations, including permits and inspections.

### 3. Select the Ideal Location

Choosing the right location for your Amana AM9S unit is critical for optimal performance. Consider the following when selecting a location:

- Indoor Unit: It should be installed in a central location to ensure even airflow throughout the space. Avoid areas with direct sunlight or heat sources that could affect performance.
- Outdoor Unit: Place it on a stable surface away from debris, vegetation, and direct sunlight. Ensure there is adequate clearance around the unit for airflow and maintenance.

## Installation Steps

Once you have completed the preparation phase, you can begin the installation process. Follow these steps carefully:

### 1. Install the Indoor Unit

- Mounting the Indoor Unit:
  - Use a level to mark the position for the mounting bracket on the wall.
  - Drill holes for the mounting screws, ensuring that the bracket is secured to a stud or appropriate wall support.
  - Attach the mounting bracket to the wall.
- Connect Refrigerant Lines:
  - Drill a hole through the wall for the refrigerant lines, ensuring it slopes slightly downward toward the outside to allow for drainage.
  - Run the refrigerant lines through the hole, and seal it with insulation.
- Electrical Connections:
  - Connect the electrical wiring according to the manufacturer's wiring diagram. Ensure that all connections are tight and secure.
  - Install a disconnect switch near the indoor unit for safety.

### 2. Install the Outdoor Unit

- Positioning the Outdoor Unit:
  - Place the outdoor unit on a concrete pad or mounting brackets to ensure stability.
  - Verify that the unit is level using a level tool and adjust as necessary.
- Connect Refrigerant Lines:
  - Connect the refrigerant lines from the indoor unit to the outdoor unit, ensuring that the connections are tight and leak-free.
  - Insulate any exposed refrigerant lines to prevent energy loss.

- Electrical Connections:
- Follow the wiring diagram provided in the manual to connect the outdoor unit to the power supply.
- Ensure that the disconnect switch is installed and that the circuit is properly grounded.

### **3. Install the Condensate Drain Line**

- Drainage Setup:
  - Connect the condensate drain line to the indoor unit's drain outlet.
  - Ensure that the drain line slopes downward to prevent clogging and promote proper drainage.
- 
- Test for Leaks:
  - Fill the drain pan with water to check for any leaks in the connections. If leaks are detected, tighten the connections or replace necessary components.

### **4. Vacuum the Refrigerant Lines**

Before charging the system with refrigerant, you must remove any moisture and air from the refrigerant lines:

- Connect a vacuum pump to the service port of the outdoor unit using the manifold gauge set.
- Run the vacuum pump for at least 30 minutes to achieve a deep vacuum (below 500 microns).
- Monitor the gauges to ensure the vacuum holds steady, indicating that there are no leaks.

### **5. Charge the System with Refrigerant**

Once the vacuum process is complete, you can charge the system with refrigerant:

- Open the service valves on the outdoor unit to allow refrigerant to flow into the system.
- Use the manifold gauge set to monitor the pressure and ensure it matches the manufacturer's specifications.
- Close the service valves once the correct charge is achieved.

## **Testing and Finalizing the Installation**

After completing the installation, it's essential to test the system to ensure it operates correctly.

### **1. Power On the System**

- Restore power to the outdoor unit and turn on the indoor unit via the thermostat.
- Check that all components are functioning properly, including the blower motor, compressor, and fan.

## 2. Check Airflow and Temperature

- Use a thermometer to measure the temperature of the air coming from the vents to ensure it matches expected performance levels.
- Check for proper airflow throughout the space and make adjustments to the vents if necessary.

## 3. Inspect for Leaks

- After running the system for a short period, inspect all refrigerant line connections for any signs of leaks.
- Use a leak detector or soap solution to check joints and connections.

## Maintenance Tips

To keep your Amana AM9S system running efficiently, regular maintenance is essential. Here are some tips:

- Regularly Change Filters: Replace or clean the air filters every 1-3 months to maintain airflow and air quality.
- Clean Coils: Ensure that both the indoor and outdoor coils are clean and free of debris.
- Inspect Refrigerant Lines: Regularly check the refrigerant lines for insulation and leaks.
- Schedule Professional Maintenance: Have a certified technician perform annual maintenance to ensure optimal performance.
