Limits and Continuity

Understanding limits and continuity forms the foundation of AP Calculus AB. Limits describe the behavior of a function as the input approaches a certain value, which is essential for defining derivatives and integrals.

Definition of a Limit

The limit of a function $f(x)$ as x approaches a value c is the value that $f(x)$ approaches as x gets arbitrarily close to c . Symbolically, this is written as $\lim_{x \rightarrow c} f(x) = L$. Limits can be evaluated using direct substitution, factoring, rationalizing, or applying special limit laws.

Continuity

A function is continuous at a point $x = c$ if three conditions are met: $f(c)$ is defined, the limit of $f(x)$ as x approaches c exists, and the limit equals $f(c)$. Continuity means there are no breaks, jumps, or holes at that point.

Common Limit Properties

- Sum Rule: $\lim_{x \rightarrow c} [f(x) + g(x)] = \lim_{x \rightarrow c} f(x) + \lim_{x \rightarrow c} g(x)$
- Product Rule: $\lim_{x \rightarrow c} [f(x) \cdot g(x)] = (\lim_{x \rightarrow c} f(x)) \cdot (\lim_{x \rightarrow c} g(x))$
- Quotient Rule: $\lim_{x \rightarrow c} [f(x)/g(x)] = (\lim_{x \rightarrow c} f(x)) / (\lim_{x \rightarrow c} g(x))$ provided $\lim_{x \rightarrow c} g(x) \neq 0$
- Squeeze Theorem for limits trapped between two functions

Differentiation Rules and Applications

Differentiation constitutes a major component of the AP Calculus AB curriculum. It involves finding the derivative, which represents the instantaneous rate of change or slope of the tangent line to a curve.

Basic Differentiation Rules

The power rule, product rule, quotient rule, and chain rule are fundamental for calculating derivatives of a variety of functions.

- **Power Rule:** $d/dx [x^n] = n x^{n-1}$
- **Product Rule:** $d/dx [u \cdot v] = u' \cdot v + u \cdot v'$
- **Quotient Rule:** $d/dx [u/v] = (v \cdot u' - u \cdot v') / v^2$
- **Chain Rule:** $d/dx [f(g(x))] = f'(g(x)) \cdot g'(x)$

Derivatives of Common Functions

Key derivatives include:

- $d/dx [\sin x] = \cos x$
- $d/dx [\cos x] = -\sin x$
- $d/dx [e^x] = e^x$
- $d/dx [\ln x] = 1/x \ (x > 0)$

Applications of Derivatives

Derivatives are used for finding critical points, determining intervals of increase and decrease, and solving optimization problems. The first and second derivative tests assist in analyzing function behavior.

Integration Techniques and the Fundamental Theorem of Calculus

Integration is the inverse process of differentiation and is crucial for calculating areas under curves and solving accumulation problems.

Basic Integration Rules

Integral formulas and methods such as substitution and integration by parts are essential tools.

- $\int x^n dx = (x^{n+1}) / (n+1) + C$, for $n \neq -1$
- $\int e^x dx = e^x + C$
- $\int 1/x dx = \ln|x| + C$
- $\int \sin x dx = -\cos x + C$
- $\int \cos x dx = \sin x + C$

Fundamental Theorem of Calculus

This theorem connects differentiation and integration, stating that if F is an antiderivative of f on an interval $[a, b]$, then:

1. $\int_a^b f(x) dx = F(b) - F(a)$
2. $d/dx [\int_a^x f(t) dt] = f(x)$

Applications of Integration

Integration is used for calculating areas between curves, displacement from velocity functions, and solving problems involving accumulation of quantities.

Graphical Analysis and Curve Sketching

Analyzing graphs is a critical skill in AP Calculus AB, enabling students to interpret function behavior quickly and accurately.

Critical Points and Extrema

Critical points occur where the derivative is zero or undefined. These points help identify local maxima, minima, or saddle points by using first or second derivative tests.

Concavity and Inflection Points

The second derivative indicates concavity. If $f''(x) > 0$, the graph is concave up; if $f''(x) < 0$, concave down. Inflection points occur where concavity changes.

Asymptotes and Behavior at Infinity

Vertical asymptotes occur where the function approaches infinity at certain x-values, while horizontal asymptotes describe end behavior as x approaches $\pm\infty$.

Common Formulas and Theorems

A reliable AP Calculus AB cheat sheet includes frequently used formulas and theorems vital for problem solving and exam success.

- **Derivative of Inverse Functions:** $(f^{-1})'(x) = 1 / f'(f^{-1}(x))$
- **Mean Value Theorem:** If f is continuous on $[a, b]$ and differentiable on (a, b) , then there exists c in (a, b) such that $f'(c) = (f(b) - f(a)) / (b - a)$
- **Average Value of a Function:** $f_{\text{avg}} = (1/(b - a)) \int_a^b f(x) \, dx$
- **Acceleration and Velocity:** If $s(t)$ is position, then velocity $v(t) = s'(t)$, acceleration $a(t) = v'(t) = s''(t)$
