Core Topics and Curriculum Content

The curriculum of AP Calculus AB is comprehensive and covers several key areas of calculus. The course content is organized into major topics that collectively build students' understanding of differential and integral calculus.

Limits and Continuity

Limits are the cornerstone of calculus, and the course begins with an in-depth study of limit concepts. Students learn how to evaluate limits analytically and understand their significance in defining derivatives and integrals. Continuity is explored to understand where functions behave predictably, which is critical for applying calculus concepts correctly.

Differentiation

Differentiation is a major focus of the course, emphasizing how to find the derivative of various types of functions. Students learn differentiation rules, including the product, quotient, and chain rules, and apply these to polynomial, trigonometric, exponential, and logarithmic functions. Applications of derivatives, such as finding slopes of tangent lines, rates of change, and solving optimization problems, are integral parts of the curriculum.

Integration

Integral calculus is introduced through the concept of antiderivatives and definite integrals. Students learn various techniques for calculating integrals and explore the interpretation of integrals as area under a curve. The Fundamental Theorem of Calculus, which connects differentiation and integration, is a key topic that students master during the course.

Applications of Integration

Beyond calculating integrals, students apply integration to solve real-world problems involving accumulation, such as computing areas between curves and solving problems related to motion and growth.

Functions and Graphs

Throughout the course, students analyze and interpret functions using graphical, numerical, and algebraic methods. Understanding the behavior of functions is critical to mastering calculus concepts.

Summary of Core Topics

- Limits and continuity
- Derivatives and differentiation techniques
- Applications of derivatives (optimization, motion)
- Integrals and antidifferentiation
