Components of Baxter Peritoneal Dialysis System

Baxter's peritoneal dialysis system consists of several critical components that work together to deliver effective renal replacement therapy. Understanding each part is vital for proper setup and use.

Dialysis Cyclor Machine

The dialysis cyclor is an automated device that controls the inflow and outflow of dialysis solution during automated peritoneal dialysis (APD). It allows customization of treatment schedules and monitors therapy parameters such as dwell times and fill volumes.

Dialysis Solutions and Consumables

Baxter provides a range of peritoneal dialysis solutions containing varying concentrations of dextrose or icodextrin to facilitate fluid and solute removal. The manual details the preparation, storage, and handling of these solutions along with tubing sets, connectors, and transfer sets necessary for therapy administration.

Catheter and Access Devices

The peritoneal dialysis catheter is a flexible tube implanted into the patient's peritoneal cavity to enable dialysis solution exchange. The manual explains catheter care, including insertion site hygiene, securement, and monitoring for signs of infection or malfunction.

Step-by-Step Procedure for Peritoneal Dialysis

The Baxter peritoneal dialysis manual provides a systematic approach to performing peritoneal dialysis, ensuring consistency and safety in therapy delivery.

Preparation and Setup

Before initiating dialysis, the manual emphasizes hand hygiene, aseptic technique, and proper workspace arrangement. It guides users through preparing the cyclor machine, connecting tubing sets, and verifying solution compatibility and expiration dates.

Initiating and Monitoring Therapy

The manual instructs on starting the dialysis cycle, setting appropriate parameters, and monitoring patient response throughout treatment. It highlights the importance of observing for complications such as discomfort, catheter issues, or alarms indicated by the cyclor.

Completing and Disconnecting

After therapy completion, the manual details safe disconnection procedures to prevent contamination and leakage. It also covers disposal of used solutions and consumables in compliance with safety protocols.

Safety and Infection Control Measures

Infection prevention is paramount in peritoneal dialysis to avoid peritonitis and other complications. The Baxter peritoneal dialysis manual dedicates significant attention to this critical aspect.

Aseptic Techniques

The manual instructs on rigorous aseptic techniques during all exchanges, including hand washing, use of masks and gloves, and sterile connection methods. It stresses minimizing contamination risks during solution handling and catheter access.

Catheter Site Care

Proper care of the catheter exit site is essential for infection control. The manual recommends daily cleaning protocols, inspection for redness or discharge, and timely reporting of abnormalities to healthcare providers.

Emergency Procedures

The manual outlines steps to take in case of suspected infections, leaks, or mechanical failures. It advises immediate cessation of therapy when necessary and contacting medical support to ensure patient safety.
