Cell Theory

Cell theory is a fundamental principle in biology stating that:

1. All living organisms are composed of cells.
2. The cell is the basic unit of life.
3. All cells arise from pre-existing cells.

Homeostasis

Homeostasis refers to the ability of an organism to maintain a stable internal environment despite changes in external conditions. This concept is vital for understanding physiology and the functioning of living systems.

Natural Selection

Natural selection is the process by which organisms better adapted to their environment tend to survive and reproduce, leading to evolutionary changes over time. This principle is central to evolutionary biology.

Ecological Interactions

Ecology examines the interactions between organisms and their environment. Understanding relationships such as predation, competition, and symbiosis is crucial for studying ecosystems.
