3. Evolutionary Biology

Evolution is one of the most significant concepts in biology. The textbook discusses:

- The mechanisms of evolution, including natural selection and genetic drift.
- The evidence supporting evolutionary theory, such as fossil records and comparative anatomy.
- Speciation and the diversity of life on Earth.

This understanding is essential for grasping the interconnectedness of all living organisms.

4. Ecology and Ecosystems

The interactions between organisms and their environments are explored through the lens of ecology. Key topics include:

- Population Dynamics

- Community Interactions
- Ecosystem Structure and Function
- Conservation Biology
