Understanding the Basics of Circles

Circles are defined as the set of all points in a plane that are equidistant from a fixed point known as the center. The distance between the center and any point on the circle is called the radius. The general equation of a circle with center at point (h, k) and radius r can be expressed as:

$$\begin{aligned} & \backslash \\ & (x - h)^2 + (y - k)^2 = r^2 \\ & \backslash \end{aligned}$$

Key components of a circle:

- Center (h, k) : The midpoint of the circle.
- Radius (r) : The distance from the center to any point on the circle.
- Diameter: Twice the radius, it is the longest distance across the circle.

Graphing Circles in the Coordinate Plane

To graph a circle, one must identify the center and the radius from the equation. Here are the steps to graph a circle effectively:

1. Identify the Center: From the equation $((x - h)^2 + (y - k)^2 = r^2)$, find the values of h and k , which represent the x and y coordinates of the center.
2. Calculate the Radius: Take the square root of (r^2) to find the radius.
3. Plot the Center: Mark the center on the coordinate plane.
4. Draw the Circle: Use a compass or a circular object to draw the circle, ensuring that all points on the circle maintain the radius distance from the center.

Example Problem: Graphing a Circle

Problem: Graph the circle defined by the equation $((x + 2)^2 + (y - 1)^2 = 9)$.

Solution:

1. The center is at $(-2, 1)$.
2. The radius is $(r = \sqrt{9} = 3)$.
3. Plot the center at $(-2, 1)$.
4. From the center, measure 3 units in all directions (up, down, left, right) to mark points on the circle.
5. Connect these points smoothly to form the circle.

Finding the Equation of a Circle

When provided with the center and radius, writing the equation of a circle is straightforward. The general steps are as follows:

1. Identify the Center: Let's say the center is (h, k) .
2. Determine the Radius: Let the radius be r .
3. Substitute into the Formula: Plug these values into the standard equation $((x - h)^2 + (y - k)^2 = r^2)$.

Example Problem: Writing the Equation

Problem: Write the equation of a circle with center $(3, -4)$ and radius 2.

Solution:

1. Center: $(h, k) = (3, -4)$.

2. Radius: $r = 2$.

3. Equation: $((x - 3)^2 + (y + 4)^2 = 2^2) \rightarrow ((x - 3)^2 + (y + 4)^2 = 4)$.
