- Confirmed DNA's central role in heredity.

Genetic Code and Protein Synthesis

Understanding how DNA sequences translate into proteins was another major milestone. Classic experiments in molecular biology answer key in this field clarify how the genetic code is deciphered and how proteins are synthesized.

Nirenberg and Matthaei's Poly-U Experiment

This experiment cracked the first triplet codon of the genetic code. By synthesizing RNA composed of uracil bases and translating it in vitro, Nirenberg and Matthaei discovered that the codon UUU codes for the amino acid phenylalanine.

Crick's Central Dogma

Francis Crick proposed the central dogma of molecular biology, which states that genetic information flows from DNA to RNA to protein. This conceptual framework guided future research on transcription and translation processes.

- Defined the directional flow of genetic information.

- Distinguished between transcription and translation.
