Descriptive Analysis

This technique focuses on summarizing historical data to understand what has happened in the past. It answers questions like "What were our sales last quarter?" Common methods include:

- Mean, Median, Mode: Basic statistical measures to summarize data.
- Frequency Distribution: Shows how often each value occurs.
- Data Visualization: Charts and graphs that depict data trends.

Diagnostic Analysis

Diagnostic analysis goes a step further by examining the reasons behind past outcomes. It answers "Why did this happen?" Techniques include:

- Correlation Analysis: Identifies relationships between variables.
- Root Cause Analysis: Investigates the underlying causes of problems.

Predictive Analysis

Predictive analysis uses historical data to forecast future events. It answers "What is likely to happen?" Techniques include:

- Regression Analysis: Models the relationship between variables to predict outcomes.
- Time Series Analysis: Analyzes data points collected over time to identify trends.

Prescriptive Analysis

Prescriptive analysis recommends actions to achieve desired outcomes. It answers "What should we do?" Techniques include:

- Optimization Models: Determine the best course of action among various options.
- Simulation: Tests different scenarios to evaluate potential outcomes.
