Key Concepts in Linear Algebra

Understanding linear algebra requires familiarity with several key concepts:

1. **Vectors:** Objects that have both magnitude and direction, represented in n -dimensional space.
2. **Matrices:** Rectangular arrays of numbers used to represent linear transformations and systems of equations.
3. **Determinants:** Scalar values derived from a square matrix that provide insights into the properties of the matrix, including invertibility.
4. **Eigenvalues and Eigenvectors:** Special vectors that remain in the same direction after a linear transformation is applied, along with their associated scalar values.
5. **Vector Spaces:** Collections of vectors that can be added together and multiplied by scalars, adhering to specific axioms.
