1. The River Crossing Puzzle

This classic logic problem involves three items: a wolf, a goat, and a cabbage. The goal is to transport all three across a river using a boat that can only hold one item at a time. The challenge lies in ensuring that the wolf does not eat the goat, and the goat does not eat the cabbage when left alone. The solution requires strategic planning and logical reasoning.

2. The Four-Digit Code

In this puzzle, an individual must guess a four-digit code based on a series of clues. For example, one clue may indicate that two digits are correct but

in the wrong position, while another clue may suggest that one digit is correct and in the right position. Solving this puzzle requires logical deduction and careful analysis of the clues.

3. The Birthday Problem

This statistical puzzle involves determining the probability that in a group of people, at least two individuals share the same birthday. The counterintuitive nature of this problem leads to surprising conclusions, making it a fascinating topic for discussion and exploration.

4. The Monty Hall Problem

Based on a game show scenario, this problem presents a choice between three doors, behind one of which is a car (the prize) and behind the others are goats. After the contestant chooses a door, the host reveals a goat behind one of the remaining doors. The contestant is then given the option to stick with their original choice or switch to the other unopened door. Analyzing this problem reveals insights into probability and decision-making.
