Understanding Diabetes

Diabetes is a chronic condition that occurs when the body either cannot produce enough insulin or cannot effectively use the insulin it produces. Insulin is a hormone that regulates blood sugar levels. There are two primary types of diabetes:

Type 1 Diabetes

Type 1 diabetes is an autoimmune condition where the immune system attacks insulin-producing beta cells in the pancreas. This type of diabetes usually appears in childhood or adolescence, but it can occur at any age. Individuals with Type 1 diabetes must take insulin daily to manage their blood sugar levels.

Type 2 Diabetes

Type 2 diabetes is more common and typically develops in adults, although it is increasingly being diagnosed in younger populations due to rising obesity rates. In this type, the body becomes resistant to insulin, or the pancreas fails to produce enough insulin. Management may include lifestyle changes, oral medications, and, in some cases, insulin therapy.
