Part I: First-Order Differential Equations

The initial chapters introduce first-order differential equations, discussing techniques for solving them, including:

1. **Separation of Variables:** A method that allows for the separation of variables to integrate both

sides.

2. Integrating Factors: A technique used to solve linear first-order equations.
3. Exact Equations: A discussion of how to identify and solve exact differential equations.
4. Applications: Practical applications such as population growth models and cooling laws.

Part II: Higher-Order Differential Equations

In this section, students learn about second-order and higher-order differential equations. Key topics include:

- Homogeneous and Non-Homogeneous Equations: The distinction between the two and methods for solving them.
- The Method of Undetermined Coefficients: A systematic method for finding particular solutions.
- Variation of Parameters: A technique for solving non-homogeneous equations that cannot be addressed by simpler methods.
- Applications: Examples from mechanics and electrical circuits are provided to illustrate the concepts.

Part III: Systems of Differential Equations

This portion of the book delves into systems of differential equations, which are crucial in many applications. The authors discuss:

- Linear Systems: Methods for solving linear systems using matrix theory.
- Phase Plane Analysis: An exploration of the behavior of solutions in the phase plane.
- Nonlinear Systems: Techniques for analyzing and solving nonlinear systems, including stability analysis.

Part IV: Laplace Transforms and Series Solutions

The fourth part covers advanced techniques such as:

- Laplace Transforms: A powerful tool for solving linear differential equations, especially those with initial value problems.
- Series Solutions: Methods for finding solutions to differential equations in the form of power series.

Part V: Partial Differential Equations

The final section introduces partial differential equations (PDEs), a vital area in mathematical modeling. Topics include:

- Classification of PDEs: Hyperbolic, parabolic, and elliptic equations and their characteristics.
- Separation of Variables: A method for solving PDEs that simplifies the problem into manageable parts.

- Fourier Series and Transforms: Techniques for solving PDEs that arise in heat conduction and wave propagation problems.
